I’d like to build an interactive dashboard for Dining hall data at the Claremont Colleges (or just Pomona College depending on the available data), linking dining purchases from 2023-2026 and Metafoodx food weights before and after serving from 2025-2026. The goal is to create a tool useful to people like dining staff, allowing them to check on an ongoing basis current trends in waste, track whether portion or prep changes are actually reducing waste, and spot purchasing patterns that don't line up with what's actually being consumed.
I’m not entirely sure what my data analytic method will be, as I have yet to meet with my advisor and see the available data, but I’m thinking some form of regression. The data will come from the Office of Sustainability, and my advisor is Alexis Reyes.
